VECTORS AND INTRO TO MATRICES QUBIT

MORE VECTORS

WHAT DO VECTORS MEAN FOR Q.COMP?

Qubits are two-level quantum systems that lie in the Bloch Sphere and their states can be represented as vectors

$$\vec{\psi} = \begin{pmatrix} \cos\frac{\theta}{2} \\ e^{i\phi}\sin\frac{\theta}{2} \end{pmatrix}$$

SHAPES(VECTORS)

ROWS COL

Vector shape

(#rows x #columns)

★ column vector: (n x 1)
★ row vector: (1 x m)

VECTOR TRASPOSE

The traspose is an operation which flips the shape of a vector lt does not change anything about the vector geometrically, just changes the shape

If
$$\vec{\mathbf{v}} = \begin{pmatrix} \mathbf{v}_1 \\ \mathbf{v}_2 \\ \vdots \\ \mathbf{v}_n \end{pmatrix}$$
 then its traspose is $\vec{\mathbf{v}}^T = (\mathbf{v}_1 \ \mathbf{v}_2 \cdots \mathbf{v}_n)$

If $\vec{\mathbf{w}} = (\mathbf{w}_1 \, \mathbf{w}_2 \, \cdots \, \mathbf{w}_n)$ then its traspose is $\vec{\mathbf{w}}^T = \begin{pmatrix} \mathbf{w}_1 \\ \mathbf{w}_2 \\ \vdots \\ \mathbf{w}_n \end{pmatrix}$

THE INNER PRODUCT

The traspose is an operation which flips the shape of a vector

$$\langle \overrightarrow{\mathbf{v}}_{i} \overrightarrow{\mathbf{w}} \rangle = \overrightarrow{\mathbf{v}} \overrightarrow{\mathbf{w}}^{T} = \sum_{i=1}^{n} \mathbf{v}_{i} \mathbf{w}_{i}$$

where \vec{v} , $\vec{w} \in \mathbb{R}^n$ are row vectors (scalar product/dot product)

It is a:

product/dot product)

 $\overrightarrow{\mathbf{V}} = \begin{pmatrix} \mathbf{V}_1 \\ \mathbf{V}_2 \\ \mathbf{V}_3 \end{pmatrix}, \overrightarrow{\mathbf{W}} = \begin{pmatrix} \mathbf{W}_1 \\ \mathbf{W}_2 \\ \mathbf{W}_3 \end{pmatrix}$

 $\langle \overrightarrow{\mathbf{v}}_{1} \overrightarrow{\mathbf{w}} \rangle = \overrightarrow{\mathbf{v}}^{T} \overrightarrow{\mathbf{w}}$ $= (\mathbf{v}_{1} \ \mathbf{v}_{2} \ \mathbf{v}_{3}) \begin{pmatrix} \mathbf{w}_{1} \\ \mathbf{w}_{2} \\ \mathbf{w}_{3} \end{pmatrix} = \mathbf{v}_{1} \mathbf{w}_{1} + \mathbf{v}_{2} \mathbf{w}_{2} + \mathbf{v}_{3} \mathbf{w}_{3}$ $= \sum_{i=1}^{3} \mathbf{v}_{i} \mathbf{w}_{i}$

VECTOR TO SCALAR MAPPING

CALCULATING VECTOR MAGNITUDE

$$\langle \overrightarrow{\mathbf{v}}, \overrightarrow{\mathbf{v}} \rangle = \overrightarrow{\mathbf{v}} \overrightarrow{\mathbf{v}}^T = \sum_{i=1}^n \mathbf{v}_i \mathbf{v}_i = \sum_{i=1}^n \mathbf{v}_i^2 = \|\overrightarrow{\mathbf{v}}\|^2, \overrightarrow{\mathbf{v}} \in \mathbb{R}^n$$

 $\|\overrightarrow{\boldsymbol{V}}\| = \sqrt{\sum_{i=1}^n \boldsymbol{V}_i^2}$

The inner product of a vector with itself gives us the magnitude squared of the vector

VECTOR ORTHOGONALITY

PARALLEL ORTHOGONAL ANTI-PARALLEL

x x x	g	\vec{x}	X
		g g	,
$\Theta = 0^{\circ}$		$\Theta = 90^{\circ}$	$\Theta = 18$
$\langle \vec{x}, \vec{g} \rangle = 1$		$\langle \vec{x}, \vec{y} \rangle = 0$	$\langle \vec{x}, \vec{y} \rangle =$

VECTOR NORMALIZATION

 $\frac{\overrightarrow{v}}{\sqrt{\langle \overrightarrow{v}, \overrightarrow{v} \rangle}} = \frac{\overrightarrow{v}}{\|\overrightarrow{v}\|}$

A vector is normalized if it has a magnitude of 1 (unit vector)

GEOMETRICALLY COMPARING VECTORS

 $\Theta = \cos^{-1} \left(\frac{\langle \vec{x}, \vec{y} \rangle}{\|\vec{x}\| \|\vec{y}\|} \right)$

 $\langle \vec{x}, \vec{y} \rangle = ||\vec{x}|| ||\vec{y}|| \cos \theta$

where $\theta = \angle(\vec{x}, \vec{y})$ is the angle between \vec{x} and \vec{y}

CONJUGATE TRASPOSE

$$\overrightarrow{\mathbf{v}}^{\dagger} = (\overrightarrow{\mathbf{v}}^{\dagger})^* = (\overrightarrow{\mathbf{v}}^*)^{\dagger}$$

THE COMPLEX INNER PRODUCT

$$\langle \overrightarrow{\mathbf{v}}, \overrightarrow{\mathbf{w}} \rangle = \overrightarrow{\mathbf{v}}^{\dagger} \overrightarrow{\mathbf{w}} = \sum_{i=1}^{n} \mathbf{v}_{i}^{*} \mathbf{w}_{i}$$
, where $\overrightarrow{\mathbf{v}}, \overrightarrow{\mathbf{w}} \in \mathbf{C}^{n}$

LINEAR COMBINATIONS

A linear combination of a set terms is simply the addition of those terms multiplied by scalar coefficients

In the case of vectors, a linear combination is simply a weighted sum of vectors

$$\overrightarrow{\mathbf{V}} = \mathbf{A}_1 \overrightarrow{\mathbf{V}}_1 + \mathbf{A}_2 \overrightarrow{\mathbf{V}}_2 + \mathbf{A}_n \overrightarrow{\mathbf{V}}_n = \sum_{i=1}^n \mathbf{A}_i \overrightarrow{\mathbf{V}}_i$$

In the case of quantum states, a superposition is simply a linear combination of quantum states

$$\frac{1}{\sqrt{2}} \begin{vmatrix} A \\ L \\ V \\ E \end{vmatrix} + \frac{1}{\sqrt{2}} \begin{vmatrix} D \\ E \\ A \\ D \end{vmatrix}$$
